

If cameras were intelligent, They would be called **Sentinel VisioSphere® !**

Why? Let's take an example:

Your camera currently allows you viewing at an angle of around 90° at best!

However, with a little effort it could allow you to have a 360° view... like looking through a porthole!

You need a **Sentinel VisioSphere®** to provide you with perfect peripheral vision of your site in 4 local images, providing you with 4 cameras in one!

4-09/09 - Non-contractual photos

And that's not all!

1 Recording: continuous or in case of an event

The Sentinel VisioSphere® is intelligent. But it also has a memory. It allows you to memorise all the images continuously 24 hours a day or when an event is triggered (intrusion, attack, theft, etc.) thanks to the processing power of its brain: the VisioStation® application installed on a PC on your site. An effective local surveillance station.

2 Motorisation of each image

We should have called it Cyber Vigil! Thanks to the intelligence of the Sentinel VisioSphere® and the VisioStation® application, each of the 4 images created can be motorised to automatically monitor everything in your field of vision, ensuring you can see everywhere, all of the time.

3 Be everywhere and see everything at once

You view a sequence of recorded images and discover that the action that interests you is taking place on the other side... Bad luck... Unless the intelligent Sentinel VisioSphere® has enabled you to locate the recording of the event which took place outside the field of vision!

Content and configuration necessary for the smooth running of the Sentinel VisioSphere® :

➤ Local surveillance VisioStation® **application** (supplied),
installed on a recent Windows-compatible PC (not supplied)

➤ **Sentinel VisioSphere®** (supplied)
